

Sheet 4

Problem#1

- 6.1-2** Determine the Nyquist sampling rate and the Nyquist sampling interval for the signals:
(a) $\text{sinc}(100\pi t)$; (b) $\text{sinc}^2(100\pi t)$; (c) $\text{sinc}(100\pi t) + \text{sinc}(50\pi t)$; (d) $\text{sinc}(100\pi t) + 3 \text{sinc}^2(60\pi t)$; (e) $\text{sinc}(50\pi t)\text{sinc}(100\pi t)$.

Problem#2

- 6.1-3** A signal $g(t)$ band-limited to B Hz is sampled by a periodic pulse train $p_{T_s}(t)$ made up of a rectangular pulse of width $1/8B$ seconds (centered at the origin) repeating at the Nyquist rate ($2B$ pulses per second). Show that the sampled signal $\bar{g}(t)$ is given by

$$\bar{g}(t) = \frac{1}{4}g(t) + \sum_{n=1}^{\infty} \frac{2}{n\pi} \sin\left(\frac{n\pi}{4}\right) g(t) \cos n\omega_s t \quad \omega_s = 4\pi B$$

Show that the signal $g(t)$ can be recovered by passing $\bar{g}(t)$ through an ideal low-pass filter of bandwidth B Hz and a gain of 4.

Problem#3

- 6.1-4** A signal $g(t) = \text{sinc}^2(5\pi t)$ is sampled (using uniformly spaced impulses) at a rate of: (i) 5 Hz; (ii) 10 Hz; (iii) 20 Hz. For each of the three case:
- (a) Sketch the sampled signal.
 - (b) Sketch the spectrum of the sampled signal.
 - (c) Explain whether you can recover the signal $g(t)$ from the sampled signal.
 - (d) If the sampled signal is passed through an ideal low-pass filter of bandwidth 5 Hz, sketch the spectrum of the output signal.

Problem#4

- 6.2-1** The American Standard Code for Information Interchange (ASCII) has 128 characters, which are binary coded. If a certain computer generates 100,000 characters per second, determine the following:
- (a) The number of bits (binary digits) required per character.
 - (b) The number of bits per second required to transmit the computer output, and the minimum bandwidth required to transmit this signal.
 - (c) For single error-detection capability, an additional bit (parity bit) is added to the code of each character. Modify your answers in parts (a) and (b) in view of this information.

Problem#5

6.2-2 A compact disc (CD) records audio signals digitally by using PCM. Assume the audio signal bandwidth to be 15 kHz.

- (a) What is the Nyquist rate?
- (b) If the Nyquist samples are quantized into $L = 65,536$ levels and then binary coded, determine the number of binary digits required to encode a sample.
- (c) Determine the number of binary digits per second (bit/s) required to encode the audio signal.
- (d) For practical reasons discussed in the text, signals are sampled at a rate well above the Nyquist rate. Practical CDs use 44,100 samples per second. If $L = 65,536$, determine the number of bits per second required to encode the signal, and the minimum bandwidth required to transmit the encoded signal.

Problem#6

Prob 6) A signal of bandwidth = 1KHz is transmitted by binary PCM, the maximum tolerable error in sample amplitude is 0.2% of the peak signal amplitude, the signal must be sampled at rate 20% above the nyquist rate. framing and synchronization requires an additional 0.5 % extra bits. Determine the minimum possible data rate needed for transmitting this signal.

Problem#7

6.2-6 A message signal $m(t)$ is transmitted by binary PCM without compression. If the SNR (signal-to-quantization-noise ratio) is required to be at least 47 dB, determine the minimum value of L required, assuming that $m(t)$ is sinusoidal. Determine the SNR obtained with this minimum L .
