Communications Engineering Part B

Unit 2: Telephone System

1

Module 1: Introduction to Public Switched Telephone Network (PSTN)

- History of PSTN
- Telephone Networks, Switching, and Signaling

2

History of Public Switching Telephone Network (PSTN)

1876 A. G. Bell telephone patent

Bell's original system was single wire with earth return.

16-Nov-22

Communications Eng. ELC-3251

3

3

- Transmitter (originally a carbon particle microphone) varied the electrical energy inversely proportional to the sound energy. Receiver (transducer) recreated the sound.

- Early systems used local batteries. Eventually a "common battery" model became prevalent.

16-Nov-22

Communications Eng. ELC-3251

4

4

Original PSTN

1878 The first exchange constructed in La Porte, the US that could connect any two of the 21 subscribers using manual switching (!)

Manual switching directly connected two *local loops*. Due to microphone technology, audio BW was 4 kHz

Manual switching

History of PSTN (1)

✓☐ Telegraph systems

- 1837: Wheatstone and Morse

✓☐ Telephone

- 1876: Alexander Graham Bell

☐ Automatic Switching Exchanges

sa7eb el hwar da mknsh mohandes

- 1891: Almon Brown Strowger patents first automatic exchange.
- 1920: Register-controlled setup where a subscriber number is received by a register that controls all the remaining call setup stages
- 1953: C.Clos develops theory of switch architectures

History of PSTN (2)

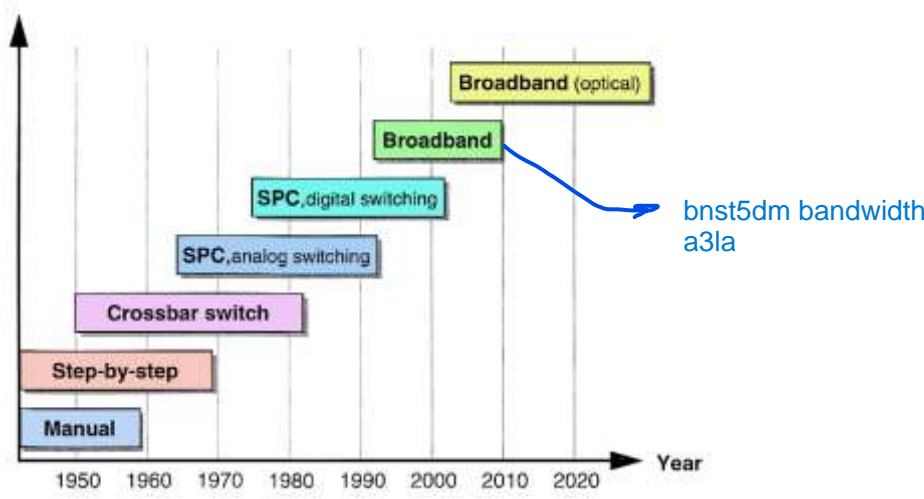

☐ Traffic Theory

- 1902: C.E. Molina
- 1915: K. D. Erlang

☐ Digitization

- 1939: Alex Reeves invents PCM
- leads to all digital networks (PDH, ISDN)
- 1965, AT&T introduced the first electronic switching systems. Stored program control (SPC).
- 1976: new type of electronic switch using time division switching was put into service

Switching Technology Evolution

9

Early Exchanges

Crossbar Switch

Strowger two-motion selector

Evolution of Telephone Sets

16-Nov-22

Communications Eng. ELC-3251

11

Telephone Networks, LAN, Switching, and Signalling

Actual telephone voice bandwidth is 3400 Hz, which is narrow than the bandwidth of the connecting wires.

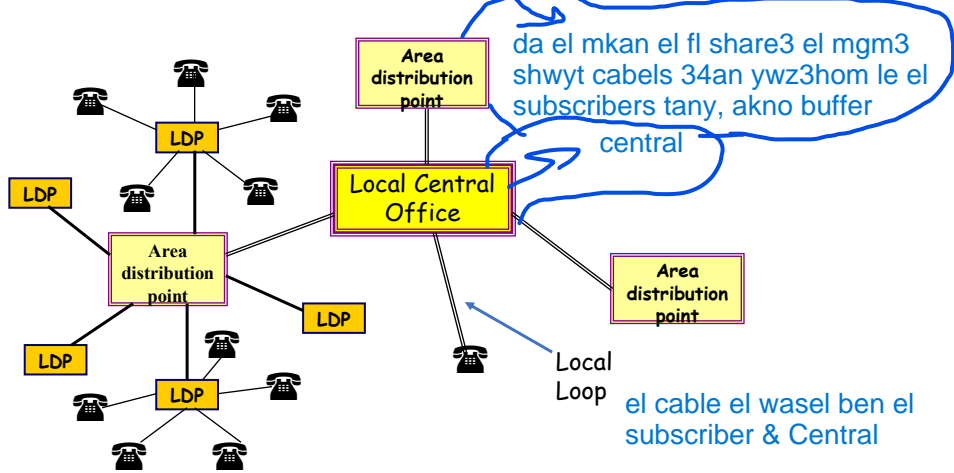

16-Nov-22

Communications Eng. ELC-3251

12

we use in the voice channel from 300 to 3400 HZ, while the remaining is called a guard band which is used to protect my signal.

Local Network Network (LAN) Architecture

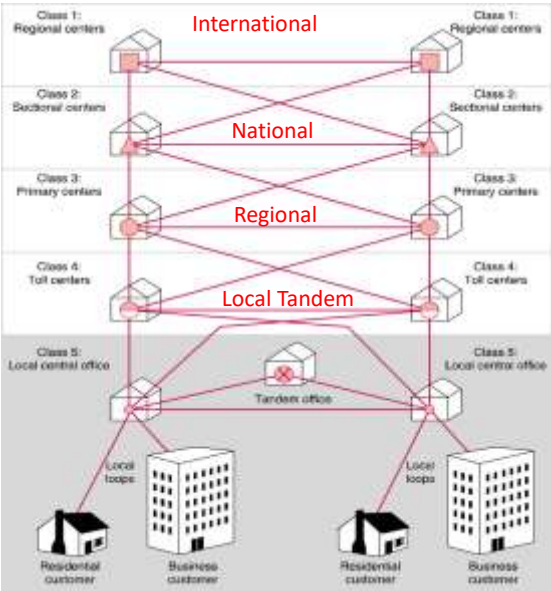

The circuit between the central office and customer is called the **local loop**. The local loop is the only remaining analog.

Network Hierarchy

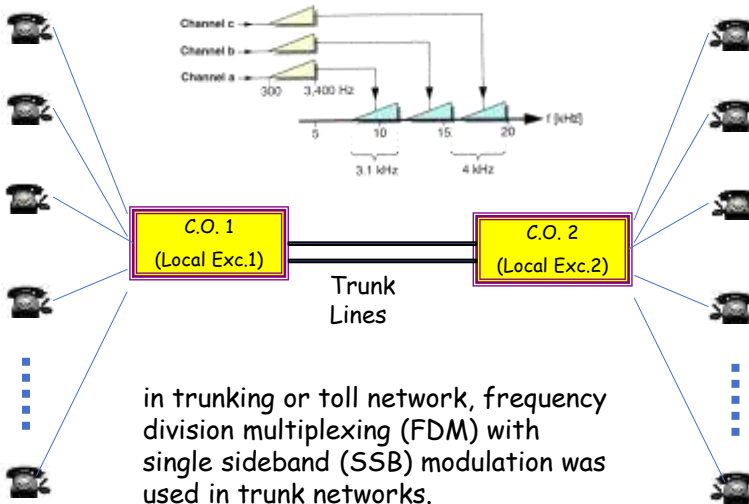

Original AT&T network hierarchy was organized in a 5 class hierarchy

Hint: Office or exchange..

Region A

Region B

16-Nov-22

Communications Eng. ELC-3251

15

15

Switching

To enable automatic switching, the telephone system must feature the following essential components:

- Addressing.
- Communications between a subscriber and a switch.
- Communications between switches.

16-Nov-22

Communications Eng. ELC-3251

16

16

Addressing in PSTN

- Each subscriber is assigned a unique number. It comprises:

International prefix	+	Country code	+	Area code	+	Subscriber number
-------------------------	---	-----------------	---	--------------	---	----------------------

e.g., 0020235678847

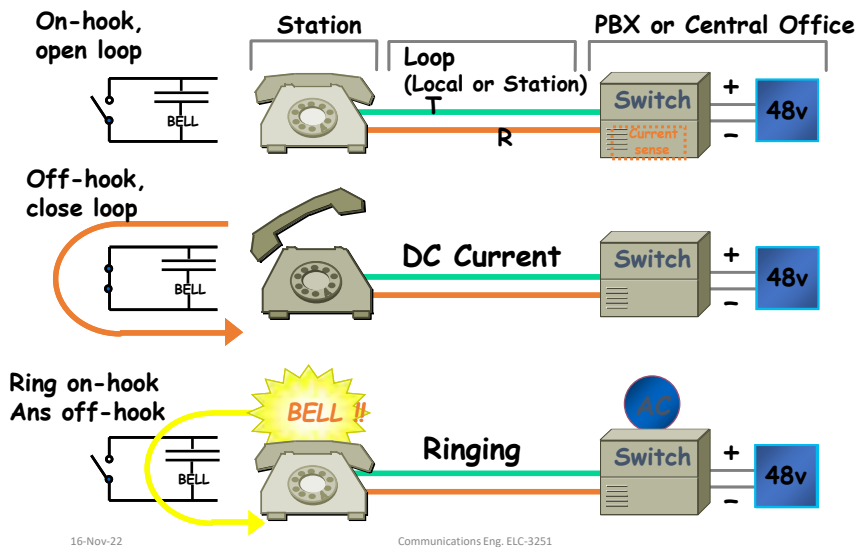

- A **calling party** enters the number of the **called party** to allow the PSTN to establish a path for the call.
- Some special numbers may be created for a specific purpose. For example: **Hunting number**.

Signaling: Subscriber ↔ Switch

- Communications between a subscriber and a switch is done by **"in-band"** signaling (except ISDN).
- In-band signaling uses the same channel to perform message exchanges between two devices. **The same telephone channel is used to:**
 - transmit dial digits (in the form of pulse signals or Dual Tone Multi Frequency tones) from a subscriber to a local switch.
 - transmit dial tone, ringing tone, etc... from a local switch to a subscriber.

Hint: ISDN stands for Integrated service digital network

Examples of Signaling: Loop Start Signaling

Dial Signals: DTMF Tones

Dual Tone Multi Frequency (DTMF) tones: a combination of two different frequencies representing each dialed digit.

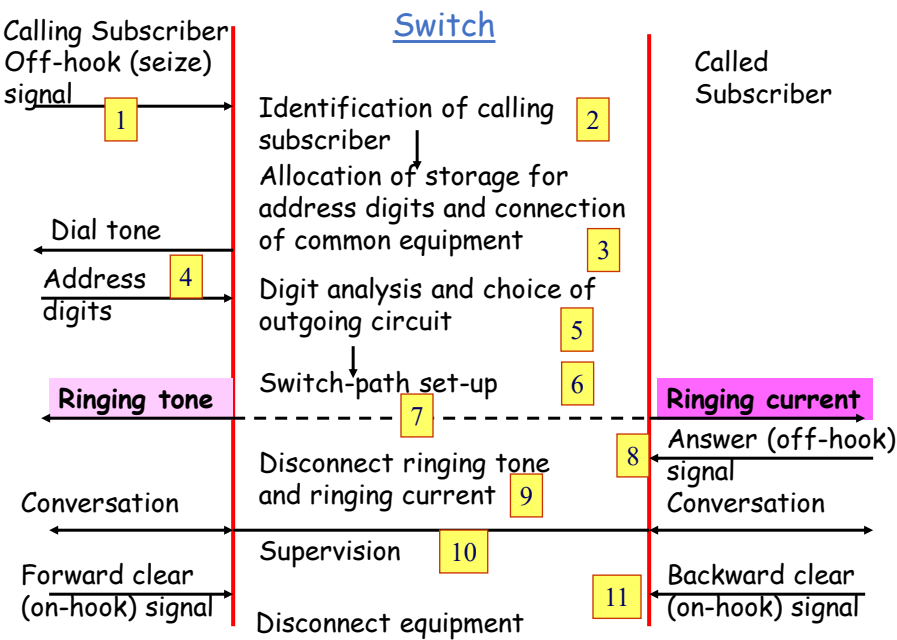

To summarize, the Signal Sequence in a call Set up (Subscriber ↔ Switch) will be as follows:

16-Nov-22

Communications Eng. ELC-3251

21

21

16-Nov-22

Communications Eng. ELC-3251

22

22

In Channel Signaling

- Use same channel for signaling and call
 - Requires no additional transmission facilities
- In-band
 - Uses same frequencies as voice signal
 - Can go anywhere a voice signal can
 - Impossible to set up a call on a faulty speech path
 - Narrow signal band within 4kHz used for control
- Out of band
 - Voice signals do not use full 4kHz bandwidth
 - Can be sent whether or not voice signals are present
 - Need extra electronics
 - Slower signal rate (narrow bandwidth)

16-Nov-22

Communications Eng. ELC-3251

23

23

Drawbacks of In Channel Signaling

- Limited transfer rate
- Delay between entering address (dialing) and connection

All these can be overcome by use of *common channel signaling (CCS)*.

Common Channel Signaling

- Control signals are carried over paths independent of voice channels.
- One control signal channel can carry signals for a number of subscriber channels.

16-Nov-22

Communications Eng. ELC-3251

24

24

Common verses In Channel Signaling

CCIS SIG: Common-channel interoffice signaling equipment
SIG: Per-trunk signaling equipment

16-Nov-22

Communications Eng. ELC-3251

25

25

Signaling System Number 7 or SS7

- Common channel signaling scheme
- Optimized for 64k digital channel network
- Call control, remote control, management and maintenance
- Reliable means of transfer of info in sequence
- Operate over analog and below 64k

Unit 2: Telephone System

Module 2: Switching Techniques

16-Nov-22

Communications Eng. ELC-3251

33

33

Switching Networks

- Long distance transmission is typically done over a network of switched nodes
- Nodes are not concerned with content of data
- End devices are stations (computer, terminal, phone, etc.)
- A collection of nodes and connections is a communications network
- Data routed by being switched from node to another.

Techniques Used in Switched Networks

- Circuit switching
- Packet switching

Circuit Switching

Dedicated communications path between two stations.
This includes:

Circuit establishment

An end to end circuit is established through switching nodes

Information Transfer

Information transmitted through the network

Data may be analog voice, digitized voice, or binary data

Circuit disconnect

Circuit is terminated

Each node de-allocates dedicated resources

16-Nov-22

Communications Eng. ELC-3251

36

36

Characteristics of Circuit Switching

- Can be inefficient
 - Channel capacity dedicated for duration of connection
 - Utilization not 100%
 - Delay prior to signal transfer for establishment
- Once established, network is transparent to users
- Information transmitted at fixed data rate with only propagation delay

16-Nov-22

Communications Eng. ELC-3251

37

37

Traditional Circuit Switching

In electronic exchanges; there are two types of software (firmware):
System software (to deal with Control of timing, scheduling, interrupt handling, inter-process communications, input/output control, storage management, and human machine communication)
Application software (to deal with call processing , and maintenance)

16-Nov-22

Communications Eng. ELC-3251

38

38

Packet switching

- Messages split into series of blocks that is transmitted in small packets, typically 1000 bytes.
- Each packet contains a portion of user data plus some control info such as Routing (addressing) info.
- Packets are received, stored briefly (buffered) and past on to the next node (Store and forward)

16-Nov-22

Communications Eng. ELC-3251

39

39

Advantages

- **Line efficiency**
 - Single node to node link can be shared by many packets over time
 - Packets queued and transmitted as fast as possible
- **Data rate conversion**
 - Each station connects to the local node at its own speed
 - Nodes buffer data if required to equalize rates
- **Packets are accepted even when network is busy**
 - Delivery may slow down
- **Priorities can be used**

Packet Switching Techniques:

- Station breaks long message into packets
- Packets sent one at a time to the network
- Packets handled in two ways
 - Datagram
 - Virtual circuit

Datagram

- Each packet treated independently
- Packets can take any practical route
- Packets may arrive out of order
- Packets may go missing
- Up to receiver to re-order packets and recover from missing packets

16-Nov-22

Communications Eng. ELC-3251

42

42

Datagram Diagram

16-Nov-22

Communications Eng. ELC-3251

43

43

Virtual Circuit

- Preplanned route established before any packets sent
- Call request and call accept packets establish connection (handshake)
- Each packet contains a virtual circuit identifier instead of destination address
- No routing decisions required for each packet
- Clear request to drop circuit
- Not a dedicated path

16-Nov-22

Communications Eng. ELC-3251

44

44

Virtual Circuit Diagram

16-Nov-22

Communications Eng. ELC-3251

45

Virtual Circuits v. Datagram

- Virtual circuits
 - Network can provide sequencing and error control
 - Packets are forwarded more quickly
 - No routing decisions to make
 - Less reliable
 - Loss of a node loses all circuits through that node
- Datagram
 - No call setup phase
 - Better if few packets
 - More flexible
 - Routing can be used to avoid congested parts of the network

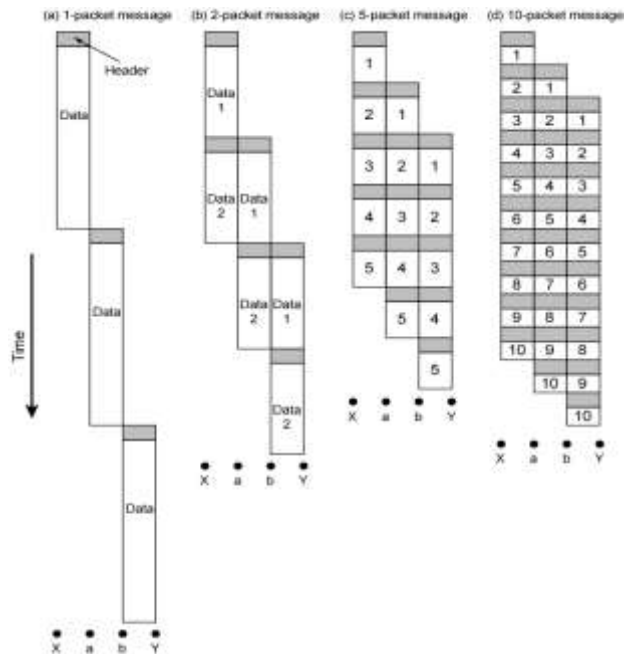

16-Nov-22

Circuit verse Packet Switching

- Performance
 - Propagation delay
 - Transmission time
 - Node delay

Event Timing

Soft switch Architecture

- The most complex part of telephone network switch is the software controlling call process which includes :
 - Call routing
 - Call processing logic

Hint: This is typically running on proprietary processor

- Any general purpose computer can run software to make it a smart phone switch (assuming digitized voice) with:
 - Lower costs
 - Greater functionality
- In soft switching,
 - call processing is separated from hardware function of switch,
 - physical switching done by media gateway, and
 - call processing done by media gateway controller

Softswitch

16-Nov-22

Communications Eng. ELC-3251

51

51

Adapting PSTN to VoIP?

All Routing Logic is managed by the Service Provider's Network .

16-Nov-22

Communications Eng. ELC-3251

52

52

Adapting PSTN to VoIP? Contd.

In most cases, IP Routing Logic is still managed by a Service Provider's Network.

VoIP Communication Protocols, such as SIP & H.323, allow control of communication routing without interfering with the Service Providers Network.

16-Nov-22

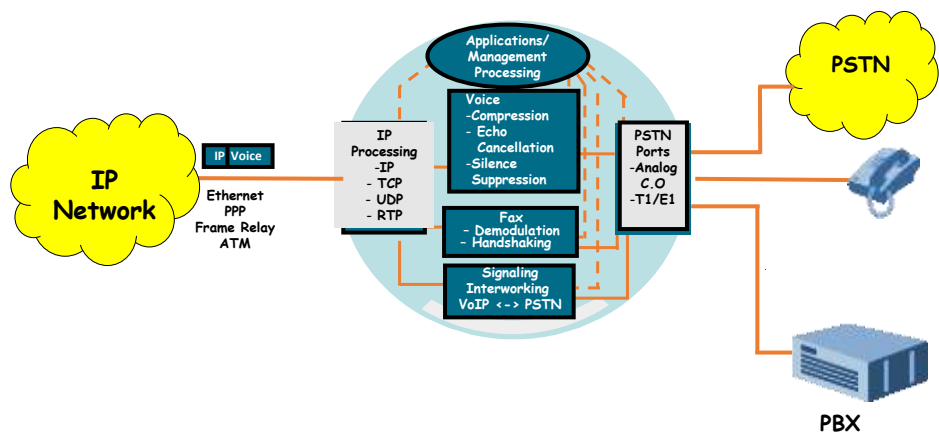

Communications Eng. ELC-3251

53

53

VoIP Media Gateways?

VoIP Media Gateways provide the bridge between PSTN Systems and VoIP
